MINIS

R&D TASK

Deployment and Mobile Release Research

01 OBJECTIVE

Recommend a practical deployment and mobile-release approach for the current MINIS application that can be implemented for the upcoming release and operated by a small team with limited budget.

The final recommendation must make clear:

- what to keep
- what to change
- what to defer
- expected cost
- what needs to start immediately
- what still needs technical validation after the research

Treat the engineering boundaries in **PROJECT-CONTEXT.pdf** as fixed for this release. If a release-blocking issue is discovered, document it for Backend Owner review rather than expanding this task into a framework, database or architecture rewrite.

02 TIMELINE

This task lasts 5 working days.

DAY 01	DAY 02	DAY 03	DAY 04	DAY 05
Context & Inputs	**Market Research**	**Shortlist Review**	**Deep Research**	**Final Recommendation**
Understand the project, confirm key business inputs and record assumptions.	Research credible options and eliminate clearly unsuitable ones.	Review the shortlist, initial recommendation and unresolved questions.	Deepen the strongest options and complete cost and mobile-release research.	Complete the results and present the final recommendation.

03 WHAT TO RESEARCH

01 PRODUCTION STACK

Research the most practical production arrangement for the existing MINIS application.

Cover:

- Spring Boot hosting
- managed PostgreSQL hosting
- object storage
- identity/authentication

Do not make each item a separate market-research project. The goal is one practical production combination plus one credible fallback. A third option may be included if it represents a genuinely different approach worth considering.

Compare options by:

- fit with the current MINIS architecture
- setup and operational effort
- reliability and important service limits
- region/latency where relevant
- migration effort and lock-in
- pricing and overage behavior
- risk to the release schedule

> **IDENTITY QUESTION**
> Is there a strong reason to replace the current identity service before this release?

If yes, explain:

- benefit
- migration impact
- user/client/backend impact
- why it is worth changing now

If no, recommend keeping it for this release and state when it should be reconsidered.

02 UPLOAD & VIDEO

Recommend an MVP upload and video strategy.

Answer:

- backend upload or direct-to-storage upload
- whether resumable/multipart upload is needed now
- accepted video profile versus transcoding
- whether transcoding is needed for the first public release
- whether thumbnails are needed now
- whether CDN is needed now
- high-level handling of failed/abandoned uploads
- what can be intentionally deferred

Do not design a future-scale video platform, complex worker system, recommendation infrastructure or speculative high-scale media architecture.

03 MINIMUM PRODUCTION OPERATIONS

Determine the minimum required setup for the selected architecture:

- production environment
- minimal staging approach, if needed
- DNS/TLS
- secrets
- PostgreSQL backup/restore
- object-storage durability
- logs and error visibility
- simple uptime alerting
- rollback

- production access/account ownership

Prefer features already included in the selected platforms.

Do not automatically introduce separate paid services for monitoring, logging, error tracking, backup or CI/CD. Recommend an additional tool only when a real release requirement is otherwise missing.

04 ANDROID & IOS RELEASE

Research the practical release path for Android and iOS.

Cover:

- developer accounts, ownership and verification
- package name / Bundle ID and signing
- Mac/Xcode/build environment
- internal/beta testing path
- public-store submission/review path
- privacy, data declarations and account deletion
- user-generated-content/moderation requirements where relevant
- account/review/verification lead-time blockers
- actions that should begin immediately

Do not perform publication or turn this into a full store-submission checklist project.

04 INPUTS TO CONFIRM

Confirm where possible:

- release scope
- monthly and one-time budget
- expected users
- expected video uploads and typical video size/duration
- expected viewing traffic
- launch countries
- billing/provider-account ownership
- DNS ownership
- Google Play account status/ownership
- Apple Developer account status/ownership
- Mac/Xcode access
- who will operate production

Do not create a separate stakeholder-interview file. Record important confirmed values and assumptions directly in the final report.

If exact values are unavailable:

- make a reasonable assumption
- clearly label it
- use Pilot, Expected Launch and Higher Growth scenarios where cost depends on usage
- identify decisions that are sensitive to the assumption

05 HOW TO COMPARE OPTIONS

Start broad enough to find credible alternatives, then eliminate unsuitable options early.

Do not compare every provider on the market.

The final report should show only:

- serious candidates that reached the shortlist
- important rejected candidates when the rejection is useful
- a short reason for each rejection
- one recommended architecture
- one fallback

Use official product documentation and official pricing for facts that can change.

Do not create weighted numeric scores.

Do not document every service found during searching.

06 DAY 3 REVIEW

Review:

- confirmed constraints and important assumptions
- shortlist
- important rejected options
- initial recommended architecture
- fallback direction
- unresolved questions

07 FINAL DELIVERABLES

Complete:

1. **FINAL-REPORT-TEMPLATE.docx**
2. **COSTS-TEMPLATE.xlsx**
3. **MOBILE-RELEASE-TEMPLATE.docx**

On Day 5, return the completed result files and present the recommendation.

No separate slide deck is required.

08 OUT OF SCOPE

This task does not include:

- production/staging implementation or cloud deployment
- PoCs or technical experiments
- Flutter/product-feature implementation
- Android/iOS publication
- provider account setup or billing obligations
- rewriting the backend, database technology or application architecture

- implementing upload, transcoding, CDN, monitoring or CI/CD
- penetration testing or a full security audit
- enterprise-scale architecture planning
- the detailed engineering roadmap that follows the research

09 COMPLETION CRITERIA

The task is complete when:

- one recommended architecture and one credible fallback are clearly justified
- important claims and prices use current official sources
- assumptions are visible
- recommendations fit the current MINIS architecture and release timing
- Pilot, Expected Launch and Higher Growth costs are estimated
- Android/iOS blockers and start-now actions are clear
- Keep / Change / Defer decisions are clear
- remaining technical uncertainties are identified for later validation
